notes:																	
	1. The outlet f	from the se	econd lago	oon, with B	OD5 = 39	mg/L would	d be fea	d to an i	dentical	3rd. L	.agoor	n produ	ucing a	14 mg/	L eff	luent	
	2. I'm taking T	KN at full	value for H	-IP calculat	tion, altho	ugh some n	itrogen	would b	e used	up for	norm	al biolo	gical/B	OD pro	cess	ses	
	3. Design spir	rit for this a	alternative	would be t	o try to ge	t away with	three F	PM lago	ons in s	eries,	totallin	g c. 9-	10 days	deten	tion.		
	4. I have used	d 20°C ww	temperatu	ure althoug	h from G	s data, actu	al temp	oerature	values	would	be m	uch hig	her, av	e 33.14	1°C		
	5. Arbitrary k-rate assumed to be 0.55 in order to hover around 10 days residence w/ three cells																
	<ol><li>Actual basi</li></ol>	n would pr	robably be	a single la	goon with	partitions ra	ather th	an isola	ted con	structi	ons, I.	e. bette	er reten	tion			
7. System is once through, I.e. no RAS help																	
8. Possible preliminary quote:																	
	tw	o 20 HP e	ach mecha	anical aera	itors for fil	rst cell											
	tw	07.5 HP 6	eacn mech	ianical aer	ators for s	econd cell		- 1		ID to t	-1				_		
	two 5 HP each mechanical aerators for third cell about 65HP total probably high speed units																
	9. Twould lab	rato an ad	tivated elu	dao altorn	partiar mi	x lagoons in a f/m=0.1 or	d 200	and/ca f	for a	cocon	dan ( cl	arifiar					
	IU. WIII CIADU	ing low so	and serate	ore and/or	auve usini rotriovable	a tuba diffus	are	gpu/sq.i	. 101 a :	Secon	Jary C	anner					
	11 Assuming	ing low sp	all from D	AF Lo hay	ving to fac		f abou	t 600 m	v/L with	same	3-coll	annro	ach wo	ild pro	hahli		
	rer	nuire c. 89	HP (just t	vne in valu	ie and see	if nrogram	works	north of	the equ	lator).	aerato	or prop	osal wo	uld pro	hahl	v he	
	to a HP each for first cell																
	two 15 HP each for second cell																
	tw	o 7.5 HP e	each for th	ird cell				at	out 10	5 HP t	otal						
	12. Aeration a	allocation/	rationale h	as been to	assign H	IP in proport	ion to e	expected	remov	als. I	m awa	re oth	er appro	aches	may	,	
propose maintaining or rather evenly spreading HP along say, min. 30 HP per mg (-> 1.35mg*3 basins *30 HP per ma = 121.5 HP needed													5 HP needed)				
	or	zig zaging	power de	nsities follo	owing son	ne other crite	eria, e.	g. Bartso	h & Ra	indall's	textile	e exam	nple.				
13. While I would to volunteer an improved design, I feel much heresy has been done already so I better quit.																	
other note	es:												,				
	14. HP for mix	xing are ca	aculated o	n the basis	s of perha	ps medium	50 to 7	U HP pe	r tank r	ng gui	aeline	s, too I	ow for c	omple	te su	spension .	
	15. Diffused a	eration is	included to	o nave a q	uick comp	arison, 0.12	: CFM ∣	per potto	orn tiooi	sq.tt.	. ⊢ina	calcs	s would	propal	ny re	ecommend	

Diffused aeration is included to have a quick companison, 0.12 CFM per bottom floor sq.ft.. "Final" calcs would probably recommer diffuser software.
Sloped basins 1:2 volume calculated according to Bronstein/Semendiaev's Math Handbook. I have been able to test results with calculator program based on Crites/Tchobanoglous formula (8-7) page 549 for side sloped earthen basins
MLSS value is only "superficially" used to quickly accluate t/m for a possible, ideal situation; does not participate much
BOD removal formula is the same as the Bartsch & Randall paper
